

Migrating to Omada Identity Cloud with the Omada Identity Cloud Accelerator Package

Successfully transition key systems to Omada's modern IGA solution within 12 weeks

To ensure a fast and successful migration from legacy to modern identity governance, the Omada Identity Cloud Accelerator Package provides a five-step process with clear success criteria.

In the ever-evolving landscape of identity governance, legacy and in-house developed systems that once served as cornerstones of access management no stand as hindrances to efficiency, security, and compliance. As organizations grapple with an increasingly complex web of users, applications, and data, the limitations of legacy and homegrown Identity Governance and Administration (IGA) systems have become glaringly apparent. These outdated solutions impede organizations' ability to rapidly adapt to shifting business needs and dynamic threat landscapes. The urgency for a modern IGA system has never been more pressing, as businesses seek agile, scalable, and future-ready solutions to navigate the intricate challenges of identity management in the digital age.

Undertaking the migration to a modern IGA solution can seem like a daunting endeavor. The complexity of transitioning established processes and integrating new technologies often brings concerns about potential disruptions, data integrity, and the learning curve associated with adopting a new platform. Time-to-value is also critical. Organizations cannot afford lengthy periods of transition; they need a swift and efficient transition that doesn't hinder operational agility or compromise security.

Accelerate IGA Projects

To streamline migrations and IGA deployments, Omada created the Omada Identity Cloud Accelerator Package. Prioritizing time-to-value, this package offers a standardized implementation approach for deployment, a best-practice framework for process design, and training for efficient user adoption. This holistic approach, encompassing everything from establishing a robust foundation to achieving end-to-end access fulfillment, streamlines the migration journey and empowers businesses to harness the advanced capabilities of the Omada Identity Cloud in a timely and effective manner. With five value steps, each organization can implement Omada Identity Cloud, with a defined roadmap for future readiness. The five steps are:

1. Establish

Build a strong IGA foundation for administrators for self-sufficiency, establish clean source data, and define your value journey.

2. Join

Gain insight into the actual state of identities and users' access with a governance overview of 'Who has access to what'.

3. Control

Perform access reviews and establish expected state to achieve compliance with business policies and regulations (e.g., ISO). Train your organization on IGA best practices for improved cyber security awareness.

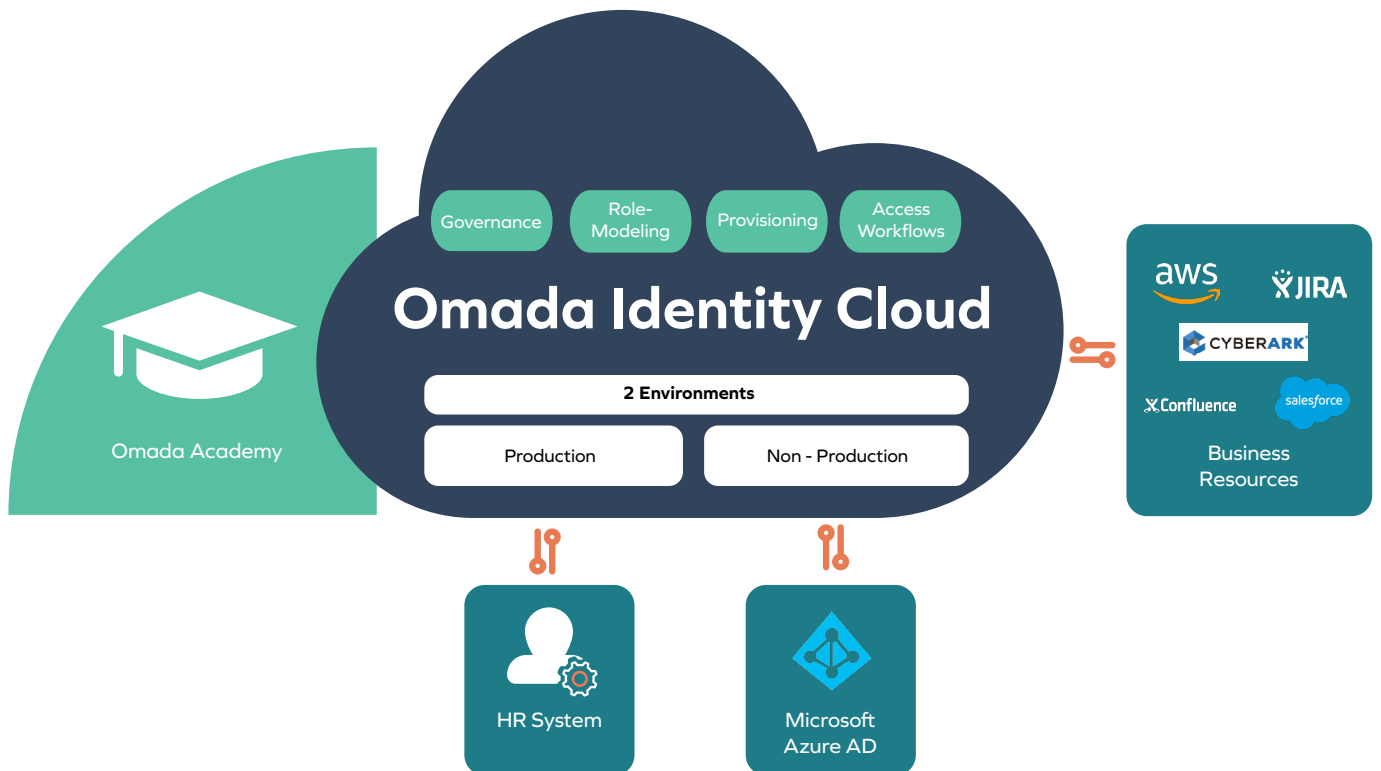

4. Expand

Enable business efficiency through self-service access request and approval workflows. Onboard one critical business system (e.g. ERP). Train users and prepare them for further IGA expansion.

5. Automate

Achieve end-to-end fulfillment of access to target systems and improved efficiency with birthright roles and policies. Improve the quality of the access review process with role descriptions and classification.

Omada Identity Cloud

What You Can Expect with the Omada Identity Cloud Accelerator Package

After 12 weeks, Omada customers migrating from their legacy or in-house developed IGA systems can expect the following tangible outcomes:

- An onboarded authoritative source to read identity data
- A full integration to directory service (AD, Azure AD, LDAP, etc.) and one additional business system
- Industrialized system onboarding
- Governance and self-service capabilities
- Basic role model with birthrights and assignment policies based on identity attributes
- Training for self-sufficiency and continued learning
- A strategic customer-specific road map for further implementation

Omada, a global market leader in Identity Governance and Administration (IGA), offers a full-featured, enterprise-grade, cloud native IGA solution that enables organizations to achieve compliance, reduce risk, and maximize efficiency. Founded in 2000, Omada delivers innovative identity management to complex cloud, on-premises, and hybrid environments based on our proven best practice process framework and deployment approach
